

GTM DATA QUALITY - AGENT SKILL

A small CSV-based prototype for finding GTM record issues and turning them into a reviewable cleanup list.

WHY I BUILT IT

- GTM teams depend on account and contact data for outreach, routing, segmentation, and reporting.
- Missing, stale, duplicate, or conflicting fields create review work and can make downstream workflows less reliable.
- The goal is not to auto-fix records; it is to surface evidence and make the next human action clear.

SAMPLE RUN

27

records reviewed

17

records with findings

19

total findings

HOW IT WORKS

Systems: CSV source → Python scripts → Agent Skill (SKILL.md) → Human review

AI boundary

Python produces the evidence. The Agent Skill explains it, groups related issues, and suggests what a human should verify. It does not decide what is true or change the CSV.

Findings in the sample

Missing 6 · Invalid 2 · Stale 3 · Conflict 5 · Review 1 · Duplicate 2

Deliberately out of scope for this POC: live CRM writes, automatic enrichment, fuzzy entity resolution, and automatic remediation.
